

A teething toy for infants and small children is styled as an illustrated book. The toy includes a number of page-like leaves, which in the preferred embodiment are fabricated from a cloth-like material, and a number of attached teething elements. The teething elements are preferably made from a relatively hard resilient material that is textured to provide effective teething relief. In one embodiment, the teething elements are integrated into artwork that is printed on the attached page leaf. The teething toy combines effective teething relief for an infant or small child with subtle encouragement to the child that books are worthwhile objects of attention.
